Cypress pine country

Landform	Undulating to low hills.			
Woody vegetation	Cypress pine scrub with occasional silver-leaved ironbark, narrow-leaved ironbark, smooth-barked apple gum and Clarkson's bloodwood. An understorey of myrtle, dysentery bush and wattles.			
Expected pasture composition	* Denotes non-native "Expected Pasture Composition" species.			
Preferred	Black speargrass, cotton panic, hairy panic.			
Intermediate	Golden beard grass, pitted bluegrass, tall chloris, barbwire grass.			
Non-preferred	Wiregrass (e.g. many-headed, Jericho), bottlewasher grasses, summer grass, poverty grass, lovegrasses.			
Annual grasses	Button grass, small burr grass, comet grass.			
Common forbs	Pimelea (non-preferred).			
Suitable sown pastures	Not suitable for development.			
Introduced weeds				
Soil	Coarse sand (tenosol).			
Description	Surface: Firm to hard-setting with rock outcrops; Surface texture: sand to sandy loam; Subsoil texture: sand to sandy loam.			
Water availability	Low to very low.			
Rooting depth	Deep			
Fertility	Low total nitrogen; low phosphorus.			
Salinity	Low			
Sodicity	Non-sodic

Land use and

management recommendations

Conservation features and related management

- Low fertility.Not suited to clearing or cultivation.
- Low soil moisture storage.
- Extensive areas of cypress pine forests occur on state forest and timber reserves and are uniquely known for their high number of endangered, vulnerable and rare species including death adders, golden-tailed geckoes and yellow-tufted honeyeaters.
- Where there is an understorey or a high density of saplings, cypress pine provides day time refuge areas for black-striped wallabies and nightjars, and habitat for birds which feed on or near the ground (e.g. spotted quail thrush, various thornbills, squatter pigeons, bronze wing pigeons, and grey thrush).
- Cypress pine forests are generally managed for low frequency, low intensity fire regimes which in turn promote a dense fine and coarse litter layer and often multiple vegetation heights.
- These forests support a rich reptile fauna that use important litter and peeling bark of old senescent trees habitat. The multi layered forests also provide habitat for a range of woodland bird species including honeyeaters, hooded robins, yellow robins and grey-crowned babblers.
- Sandy cypress ecosystems are important recharge areas for stream and groundwater.
- This land type is very susceptible to fire damage and therefore a firebreak around its periphery is warranted, especially if adjoining a dense stand of buffel grass.
- Conservation objectives should aim to manage fire in these areas, particularly for retention of fallen litter 'fuel' loads that are important for reptile species.
